NEW PRODUCTS High Performance AC Servo Systems

SANMOTION R AC SERVO SYSTEMS

3E Model

**High Performance Servo Amplifier
The Power of 3E's**

More evolved AC servo amplifiers that provide improved basic performance with high responsiveness, and are more energy-efficient and easier to use. Ideal for chip mounters, semiconductor equipment, machine tools, etc. In addition to the 10 A to 50 A capacity amplifier lineup, a new 100 A to 600 A capacity amplifier lineup has been born.

Evolved

Eco-efficient

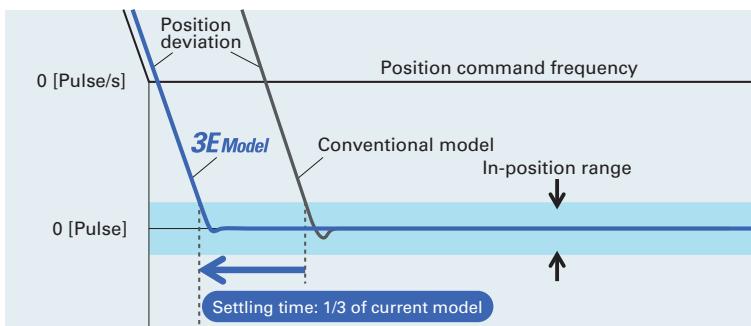

Easy to use

Evolved

Shorter takt time achieved through high-speed positioning control

The 3E Model has a speed frequency response of 2.2 kHz, approximately twice that of our conventional product.* Additionally, the position settling time has been shortened to 1/3 of the original time. Real-time switching between track control and positioning control contributes to a dramatic reduction of machine takt time.

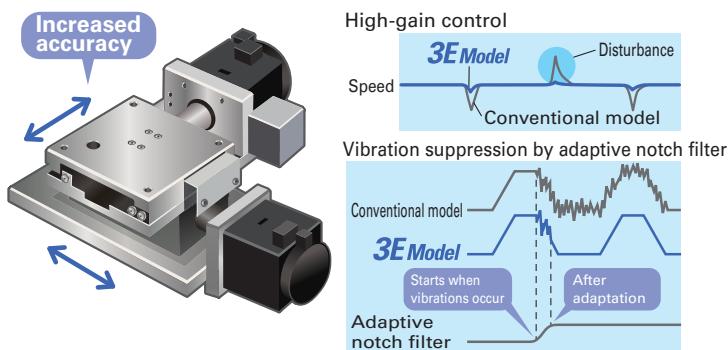

* For amplifiers with capacities from 10 A to 50 A. Compared with our conventional AC servo amplifier, "SANMOTION R ADVANCED MODEL".

Improved control accuracy

The 3E Model is equipped with a gain increase function, a function for suppressing microvibrations at settling time, an adaptive notch filter for suppressing mechanical resonance, and a feed-forward vibration control function. The 4th order notch filter of our conventional products has been upgraded to 5th order.* Highly accurate machine tool feed-axis control significantly improves processing quality.

* Compared with our conventional AC servo amplifier, "SANMOTION R" ADVANCED MODEL.

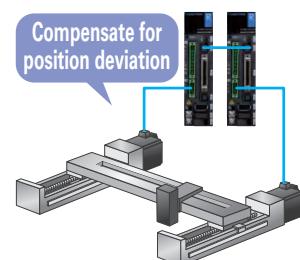

Improved safety performance through the Safe Torque Off function

With the improved Safe Torque Off (STO) function, the 3E Model conforms to international standards, SIL3/IEC61508 and PL-e/ISO13849-1. It is sufficiently reliable for usage in devices requiring high safety, such as medical devices.

High-precision tandem operation

In applications where two shafts are driven simultaneously, such as a gantry mechanism, high-precision tandem operation is possible by mutually compensating for deviation of motor positions between two shafts with the servo amplifier.

Eco-efficient

Reduced power consumption

By incorporating new-generation power devices, the 3E Model decreases electric power losses by up to 10%.* The 3E Model has up to 10% lower standby power consumption as it limits unnecessary energy consumption by controlling the fan speed according to the internal temperature of the servo amplifier.*

Power consumption visualization

The power consumption monitoring function enables power consumption to be visualized. The servo amplifier calculates power consumption based on the motor current, and displays it on the setup software or digital operator.

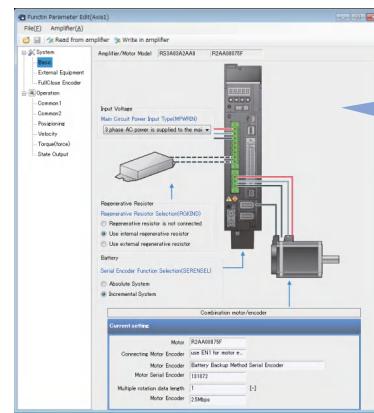

* For amplifiers with capacities from 100 A to 300 A.

Easy to use

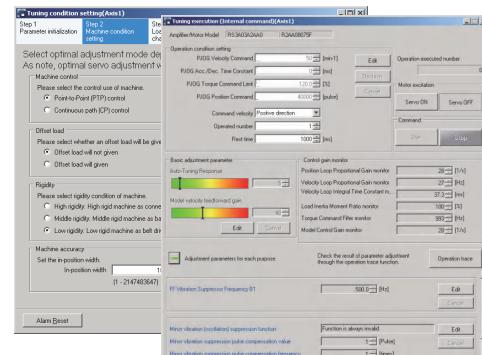

Easy startup

"SANMOTION MOTOR SETUP SOFTWARE" (see p. 10) displays the parameters required for operation in an easy-to-understand manner in order to enable fast and easy equipment startup. The 3E Model has a virtual motor operation function to simulate operation of the motor and amplifier without moving the machine, and a jog function for testing the motor and amplifier connection, without the need to connect to a host device.

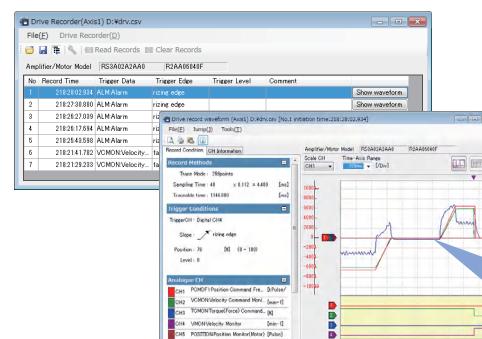

Easy servo tuning

By connecting with the setup software the 3E Model offers a variety of servo tuning support functions such as automatic selection of optimal tuning mode depending on mechanical and load conditions, basic tuning mode for adjustment of up to two parameters, and an application-specific tuning mode. This dramatically shortens time required for servo tuning.

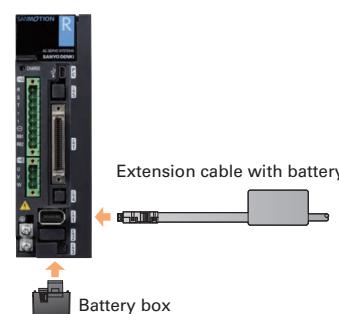

Easy troubleshooting

With a 1 ms time stamp and a drive recorder function to record motor and amplifier operating status, details of abnormal state occurrences such as alarms can be accurately checked even at a later time, facilitating troubleshooting.

Encoder batteries with choice of mounting sites

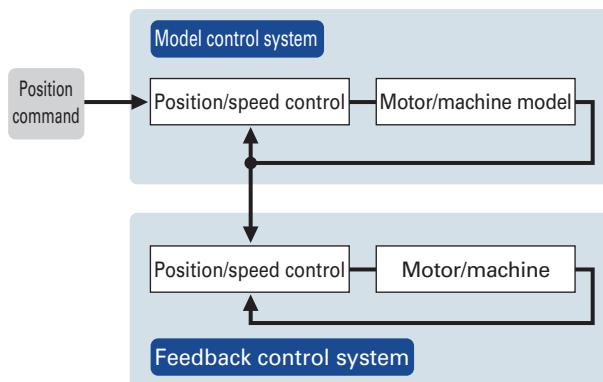

When using a battery-backup method absolute encoder, the required battery can be either a battery box that connects directly to the lower part of the servo amplifier, or an extension cable with battery. (See p. 77)

Common features of R 3E Model and R ADVANCED MODEL

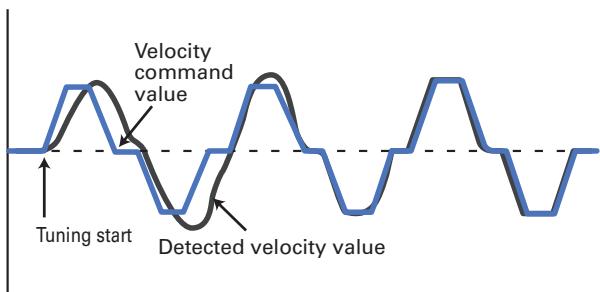

Model-based following control

Model-based following control enables an improved target value response, enhanced disturbance suppression, and greater robustness.

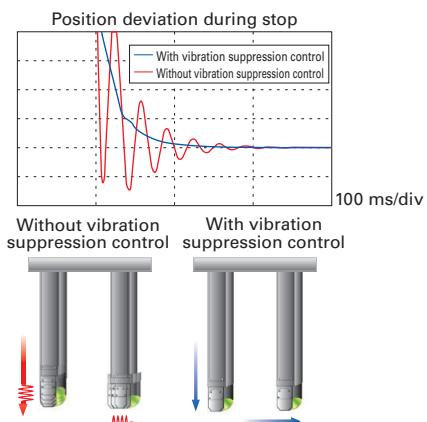

Auto-tuning

The servo amplifier automatically optimizes servo gain and filter frequency in real time.

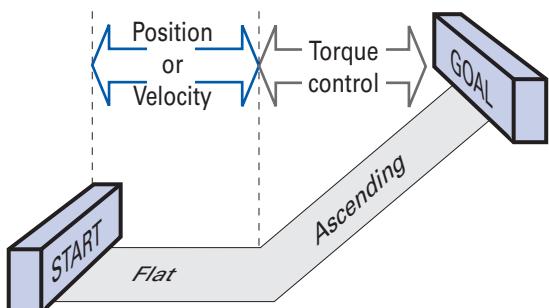

Feed-forward vibration suppression control

With feed-forward vibration suppression control, vibrations at the end effector and base of a machine can be suppressed through simple tuning procedures. Vibration control frequencies are selectable.

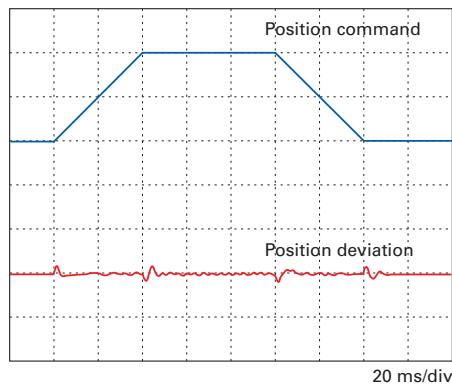

All-in-one control

Configurable parameters allow switching between control modes for torque, position or velocity.

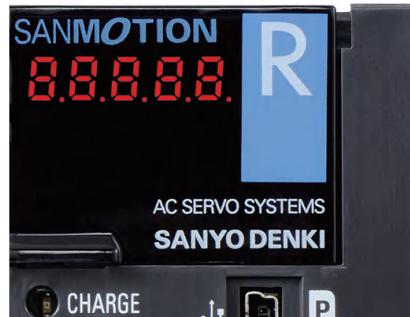

Command following control

Position command following performance doubled in comparison with conventional models through the adoption of new positioning and speed control algorithms. Position deviation $\neq 0$ has been achieved.

5-digit LED display, built-in operator

The built-in operator allows you to change parameters and monitor the amplifier status and alarm traces.

Selection Guide

Common features of R 3E Model and R ADVANCED MODEL

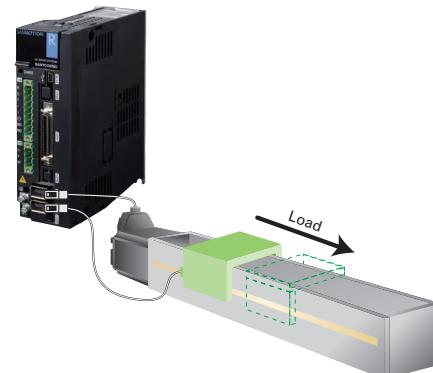

Multiaxial monitor function

The setup software allows up to 15 servo amplifier axes to be monitored.

Dual position feedback fully-closed loop control

Dual position feedback fully-closed loop control is possible by using information from two encoders, such as a linear encoder mounted on the device and a high resolution encoder. Even when there is high motor shaft torsion from the load, servo gain can be improved and high response achieved.

Medium inertia servo motors selectable for different applications

Two types of medium inertia servo motors are available: R2 servo motors with a wide lineup for positioning applications, and R5 servo motors that are ideal for smooth operations such as for feed shafts of small-sized machine tools.

Downsized servo motors

R2 series servo motors have been downsized by as much as 30% in length and 25% in volume from our conventional product, while still achieving high torque and high performance. (When using a battery-backup method absolute encoder)

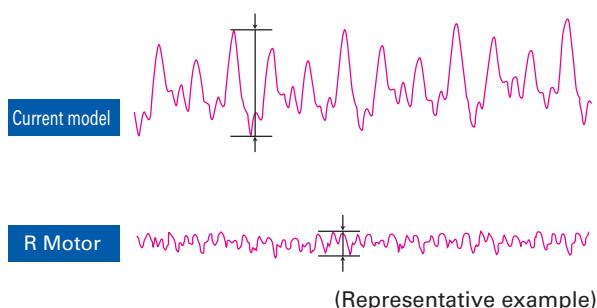

* Our conventional product is "SANMOTION Q" AC servo motor.

Low cogging torque

Cogging torque has been reduced in comparison with our conventional products, and we have achieved smooth movement.

Comparison of cogging torque waveform

Waterproof and dustproof

Our servo motors have high waterproof and dustproof characteristics with IP65 and IP67 ratings, allowing them to work in severe environments. Servo motors with IP65 ratings can be modified to IP67 as an option.

* Excluding shaft feedthrough and cable end.

High-precision battery-less optical absolute encoder

The high-precision battery-less optical absolute encoder HA035 comes standard.

It features a wide -20 to +105°C operating temperature range, and a maximum of 147 m/s² (15G)* of environmental vibration.

The encoder can be used in severe environments.

* When the encoder is mounted on a servo motor, the operating temperature and the environmental vibration vary depending on the servo motor specification.

As an optional specification, high-precision specifications with a maximum resolution of 8388608 (23 bits) during single rotation and an absolute angle accuracy of approximately 0.0167 deg within a rotation (1 min.) can be selected.

In addition, selecting an encoder that is optimal to the device is also available as an option.

Refer to the following table.

Serial encoder

Encoder type	Resolution during single rotation	Total number of rotations during multiple rotations	Encoder model no.	Optional specifications
Battery-less optical absolute encoder This is a high-precision battery-less optical multi-turn encoder. It does not use batteries, which need to be replaced; therefore, the encoder does not require maintenance. This encoder can be broadly used for general industrial equipment including machine tools and robots.	131072 (17 bits)	65536 (16 bits)	HA035	<ul style="list-style-type: none"> • Resolution during single rotation: 1048576 (20 bits), 8388608 (23 bits) • Absolute angular accuracy within one rotation: Approx. 0.0167 deg (one minute) or lower (standard is approx. 0.1667 deg (ten minutes) or lower.) • Baud rate: 4.0 Mbps (standard is 2.5 Mbps)
Optical battery-backup method absolute encoder This is a slim multi-turn battery-backup method optical encoder. It enables the use of a shorter motor; therefore, it is optimal for devices in which motor installation space is limited. Batteries sold separately. (See p. 77.)	131072 (17 bits)	65536 (16 bits)	PA035C	<ul style="list-style-type: none"> • Resolution during single rotation: 1048576 (20 bits) • Baud rate: 4.0 Mbps (standard is 2.5 Mbps)
Optical absolute encoder for incremental systems This is a slim and single-turn optical encoder. Enables wire-saving and size-reduction for applications that use pulse encoders.	131072 (17 bits)	-	PA035S	<ul style="list-style-type: none"> • Resolution during single rotation: 1048576 (20 bits) • Baud rate: 4.0 Mbps (standard is 2.5 Mbps)
Resolver method battery-less absolute encoder This is a resolver method battery-less multi-turn encoder. Being a resolver method encoder with outstanding ruggedness, it is ideal for equipment used in harsh environments such as injection molding machines and robots.	131072 (17 bits)	65536 (16 bits)	RA035C	<ul style="list-style-type: none"> • Baud rate: 4.0 Mbps (standard is 2.5 Mbps)

Pulse encoder

Encoder type	Pulse/rotation	Multiple rotations	Encoder model no.	Optional specifications
Optical wire-saving incremental encoder This is an incremental encoder that easily connects with host equipment to output phases A, B, and Z. Ideal for general industrial equipment such as chip mounters.	2000 P/R	-	PP031T	<ul style="list-style-type: none"> • Number of pulses: Up to 10000 P/R

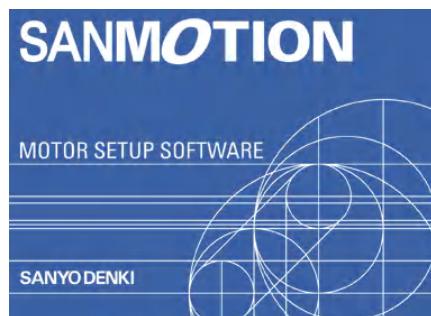

Setup Software (Option)

This software allows you to set servo system parameters from a PC.

It also allows you to easily start up or test run the servo system.

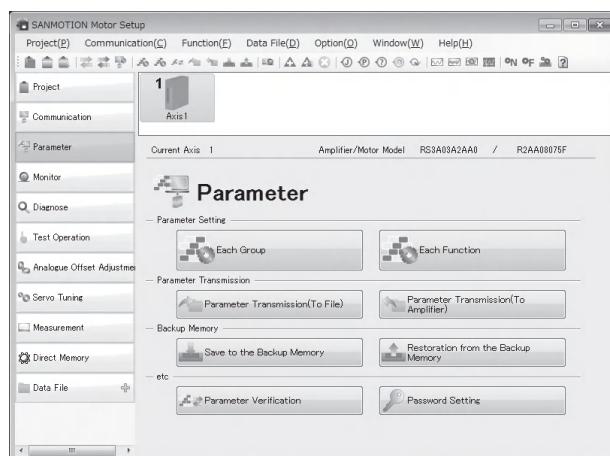

The software can be downloaded from Product Information on our website.

URL : <http://www.sanyodenki.com>

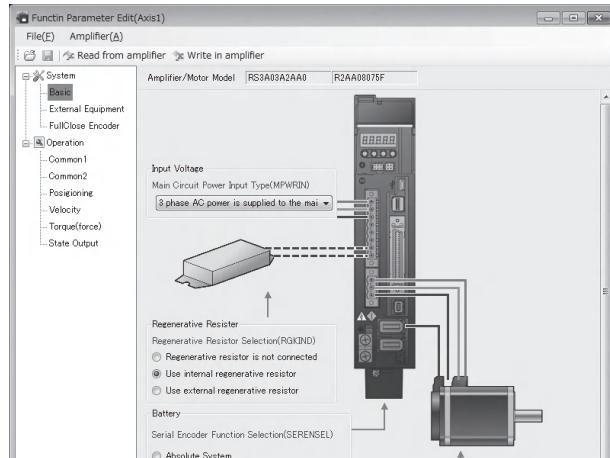

Start-up screen

Main screen

Parameter Setting screen

Function Parameter Edit

The minimum required parameters for operations can be collectively set.

■ Setup software title:

SANMOTION MOTOR SETUP SOFTWARE

■ Main Functions

Parameter settings (settings by group, settings by function)

Diagnosis (alarm display, warning display, alarm cancellation)

Test run execution (speed JOG, position JOG, motor starting point search, serial encoder clearance)

Servo tuning (notch filter tuning, FF vibration control frequency tuning)

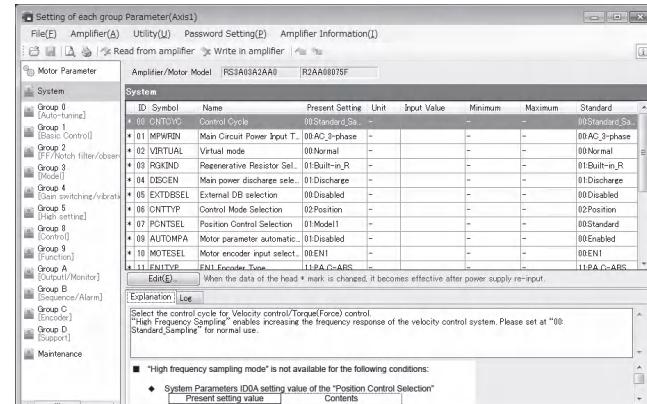

Various measurement functions (operating waveform display, machinery frequency response measurement)

* Use a USB communication cable (mini-B socket) to connect the USB port of PC and servo amplifier.

■ Supported OS

Windows XP (SP3 or higher) / Vista / 7 / 8

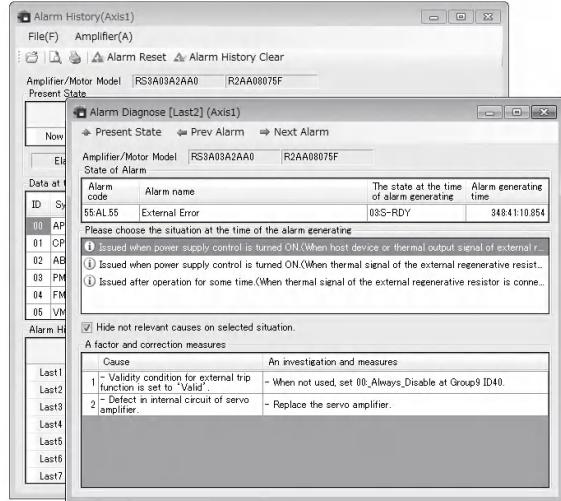

* See our website for details on supported versions.

Setting of each group Parameter

Parameters can be set, saved, and read from a PC.

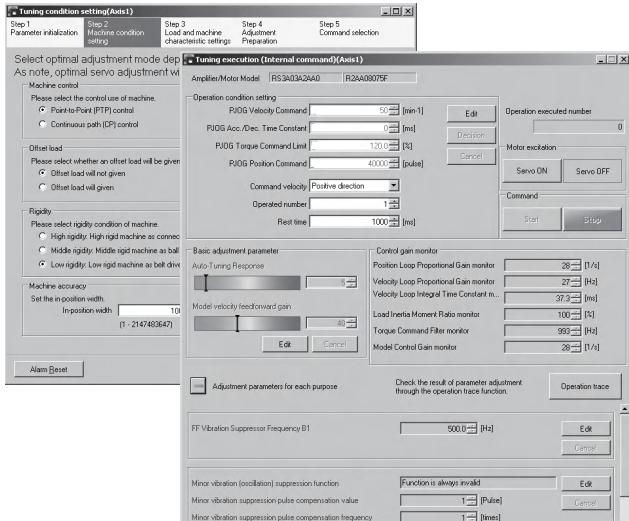

Diagnosis screen

The current and previous 15 alarm occurrences can be checked.

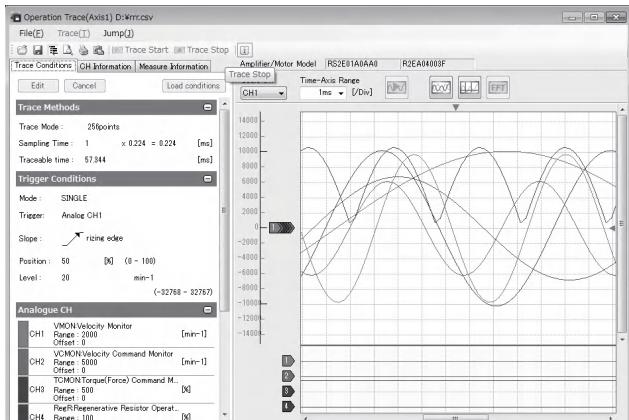

Causes and corrective actions can be checked based on alarm status.

Servo adjustment assist

By setting the mechanical conditions, easy servo adjustment is available with the optimal tuning mode.

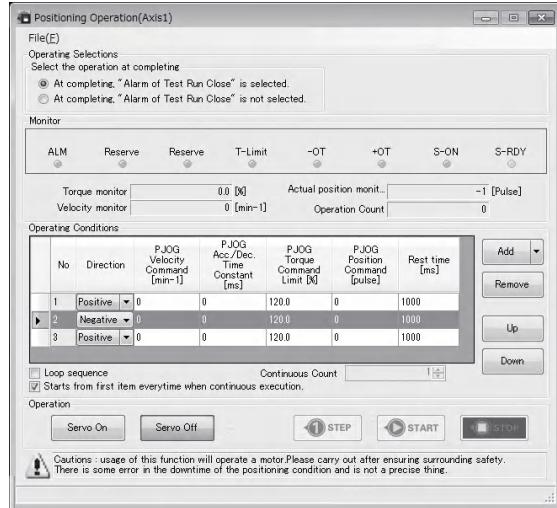

Measurement

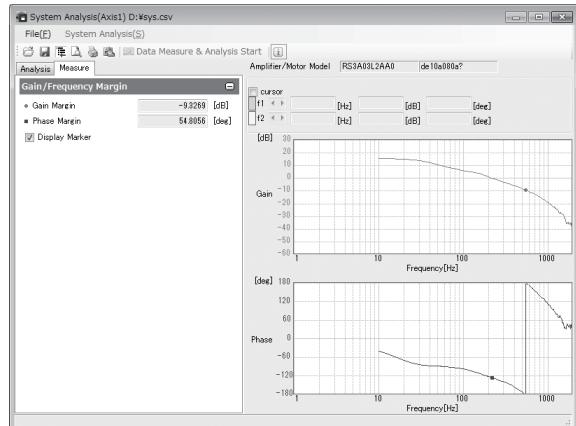

Operation Trace

Graphically displays servo motor's speed, torque and internal status.

Test run

Simple test run of servo motor by issuing velocity commands and position commands from a PC. (Position JOG in operation shown in screen)

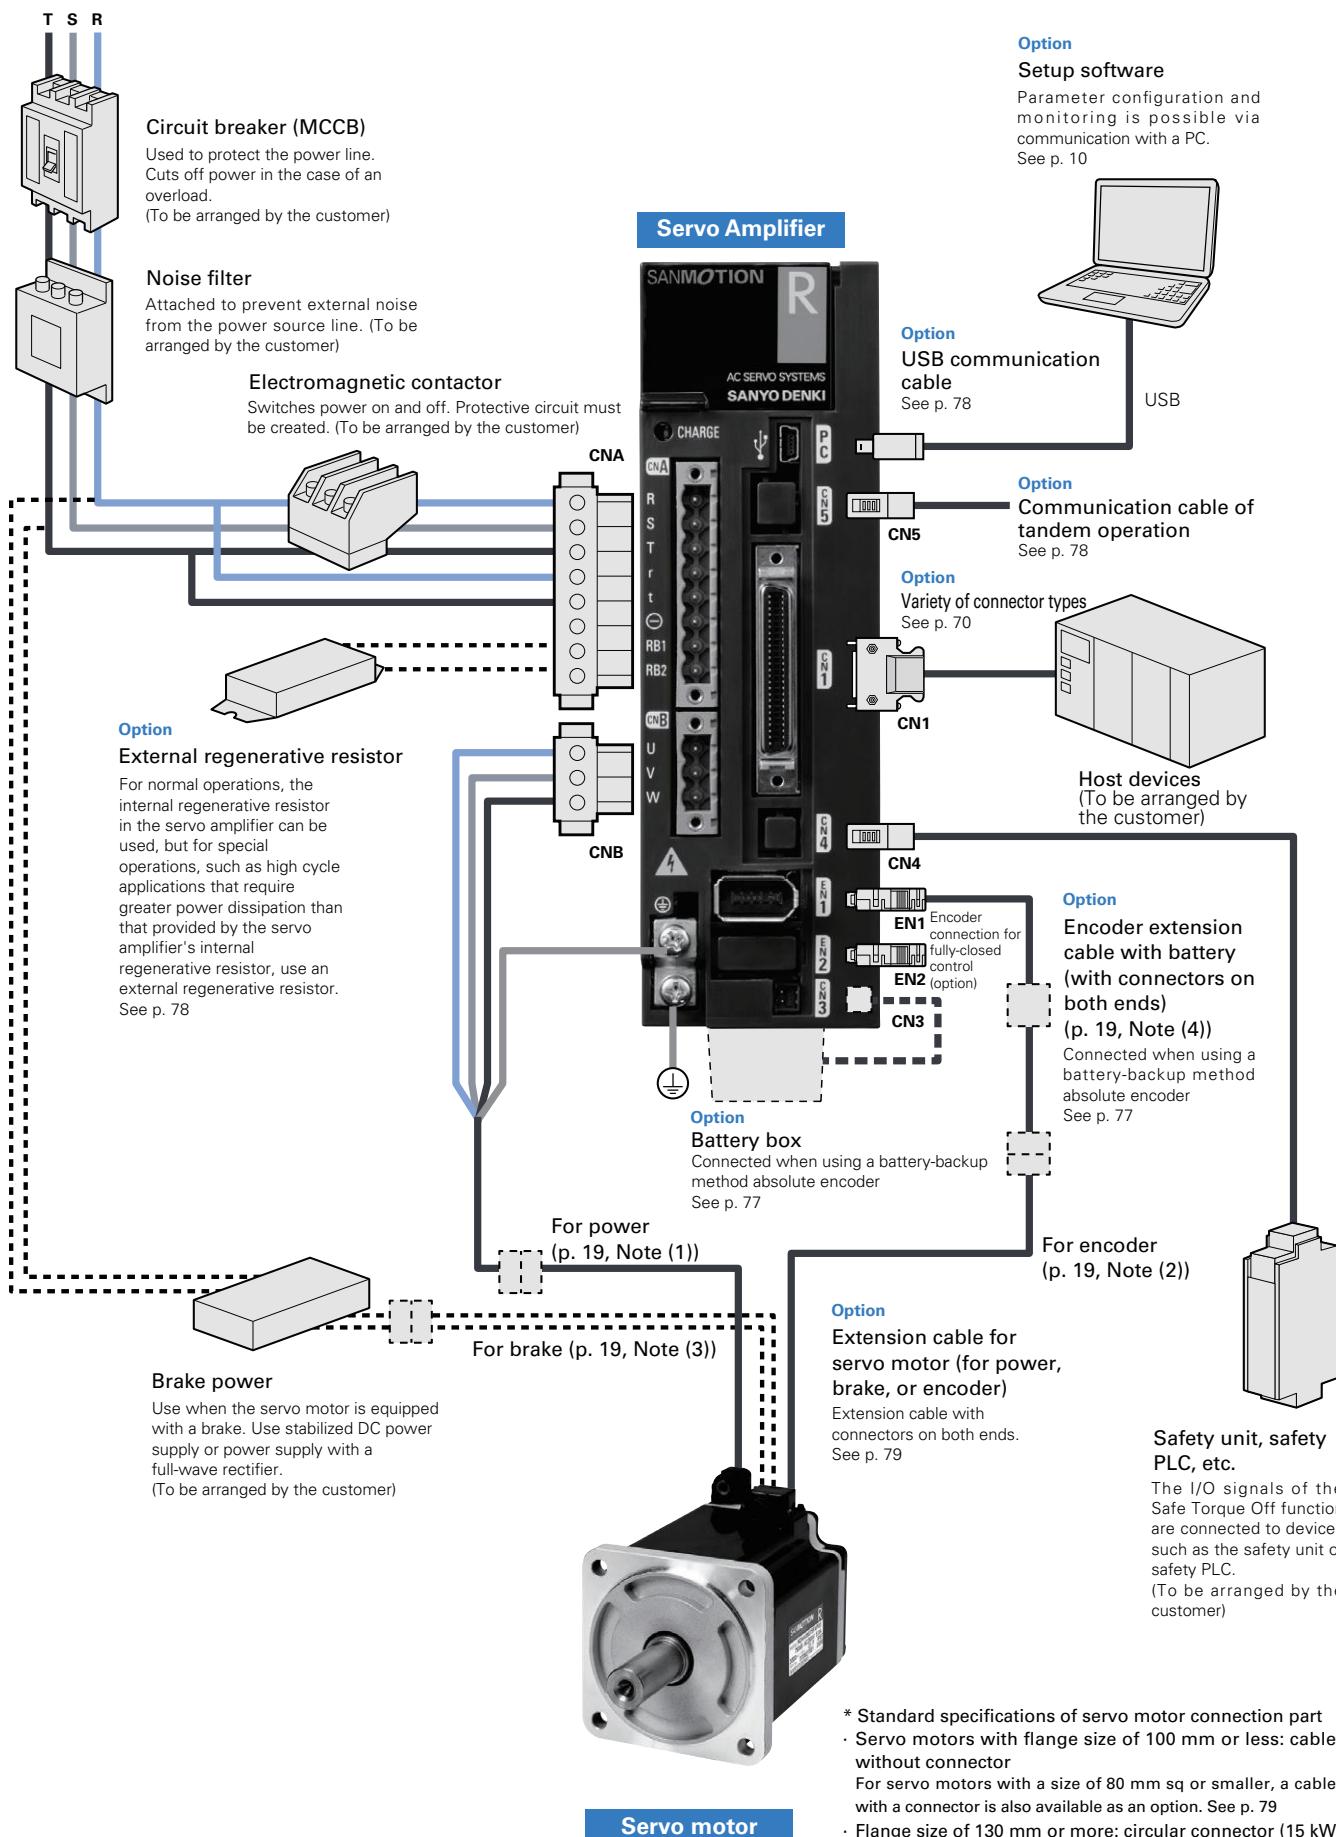

System Analysis

Analyzes servo system frequency characteristics.

Battery and associated items for battery-backup method absolute encoder · Battery box *Cannot be used with the front mounting brackets (10 A to 50 A). · Battery for battery box (Lithium battery) · Encoder extension cable with battery, with connectors on both ends · Encoder extension cable with battery, with connector on one end · Battery for encoder extension cable (Lithium battery)	p. 77	
Analog monitor related · Monitor box · Dedicated cable	p. 77	
USB communication cable	p. 78	Cable for communication with PC for setup software
Communication cable of tandem operation between amplifiers	p. 78	
External regenerative resistor	p. 78	
Servo motor extension cable	p. 79	

The following devices are to be arranged by the customer.

- Circuit breaker (MCCB), noise filter, electromagnetic contactor, brake power, safety unit, safety PLC
- Cable for servo motor with a size of 130 mm sq. or larger (check the recommended motor power line on p. 74 before preparing the cable.)

Selection Guide

Input voltage 200 V AC

- We offer 30 to 750 W AC servo motors and servo amplifiers in sets with peripheral cables and connectors.

Set contents

Servo motor
Servo amplifier
Connector

Cable (option)

- Extension cable for servo motor (1, 2, 3, 5, and 10 m)**
* Select the cable length
- Encoder extension cable with battery**
* Not necessary when used as an incremental system
- USB communication cable (1 and 2 m)**
* Select the cable length

Servo motor specifications	Protection code: IP67. CE/UL approval: no. Encoder classification: battery-backup method absolute encoder (PA035C). Output shaft: straight. Oil seal: no. Connection: connect with an extension cable. (Connector specification → p.79)
Servo amplifier specifications	Main circuit power supply: 3-phase 200 to 240 V AC. Interface: analog/pulse. General output: sink. Internal regenerative resistor. Safe Torque Off function: no.

How to Read Model Numbers

Not all combinations shown below are valid. For available models, refer to "Standard Model Number List" on pp. 22-32.

Servo Amplifier

Example: An RS3 series servo amplifier model, with 200 V AC input voltage, 10 A amplifier capacity, internal regenerative resistor, without Safe Torque Off function.

- Motor parameters need to be set for the amplifier before use.
Use the setup software.

Conformance to Safety Standards

Our standard servo amplifier achieves the KC Mark of safety and conforms to the international UL, c-UL, EN standards.

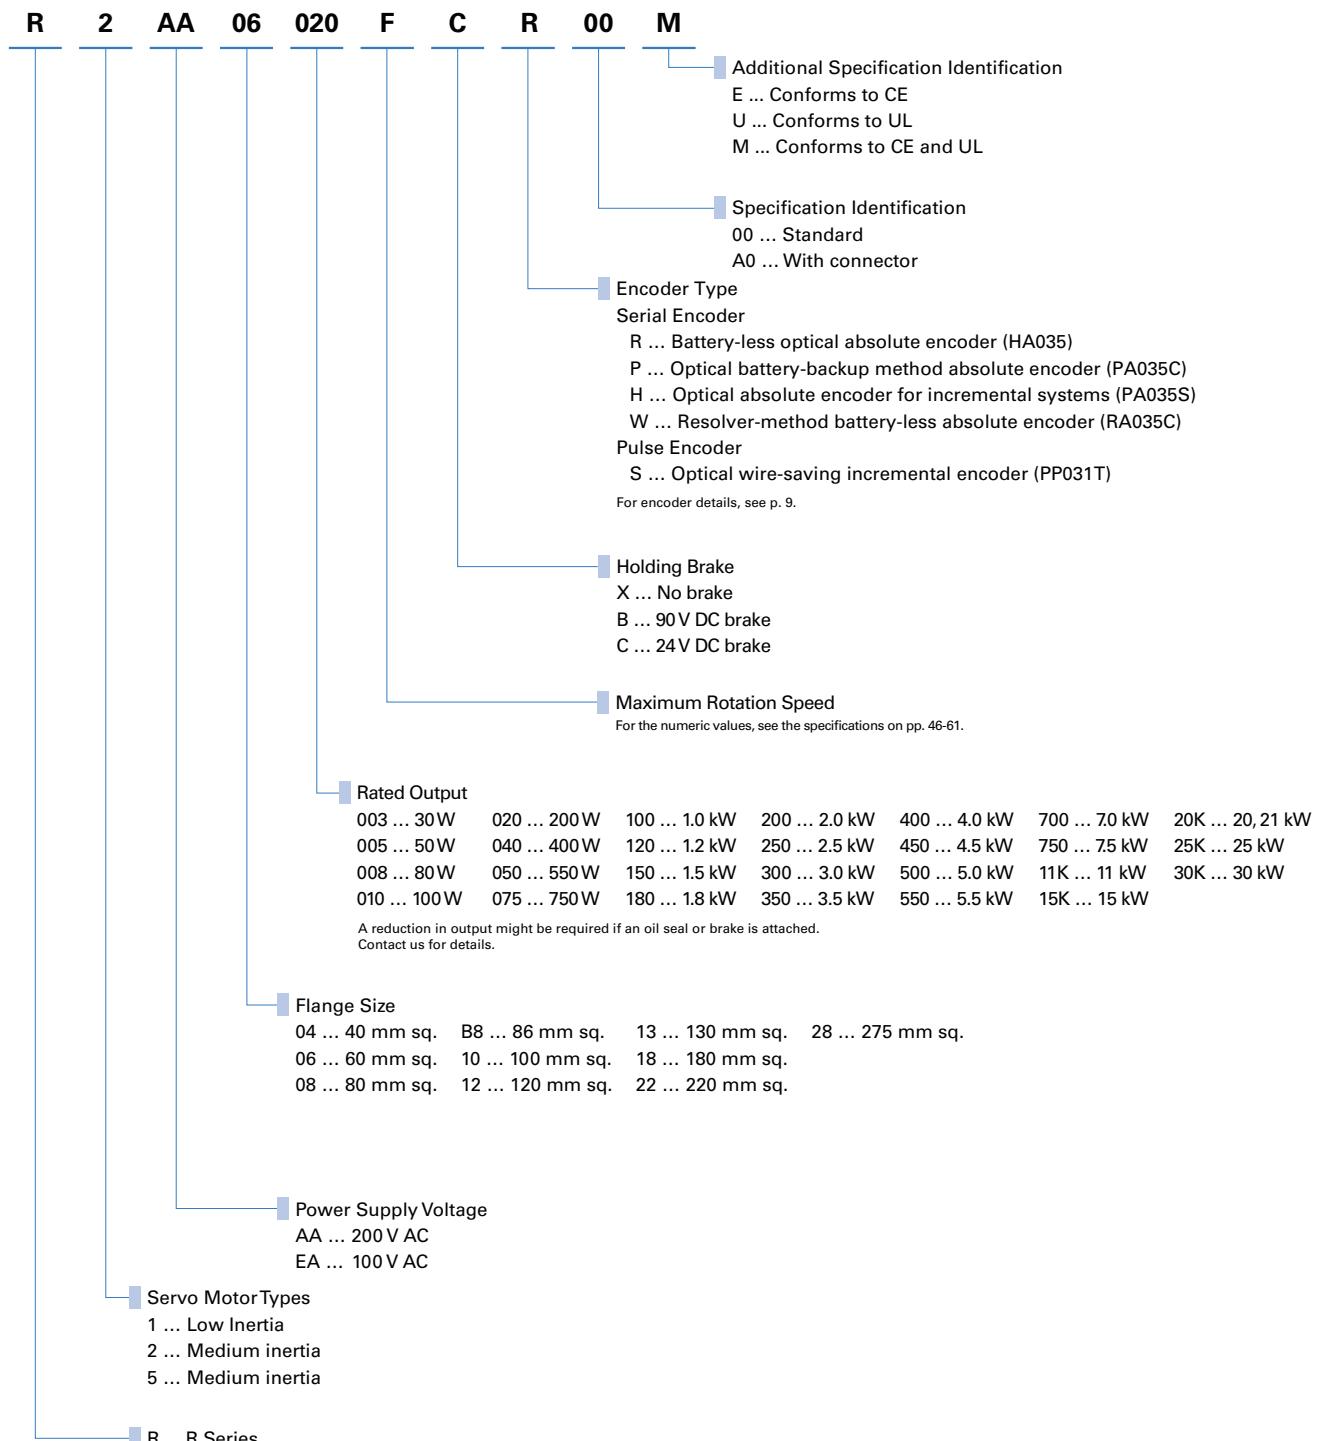

You can also employ servo motors that conform to the UL, c-UL and EN standards.

In addition, all model numbers manufactured after October 2012 in this catalog conform with the acceptable values of specific hazardous substances (cadmium, lead, mercury, hexavalent chrome, PBB, and PBDE) in Appendix II of EU RoHS directive (2011/65/EU).

Servo Motor

Example: An R2 series servo motor model with a 60 mm sq. flange size, 200 W rated output, 6000 min⁻¹ maximum rotation speed, 24 V DC brake, and a battery-less optical absolute encoder (131072 partition number/rotation), with UL/CE approval.

• For speed reducer installation, contact us for details.

Servo Amplifier

Servo Amplifier Specifications

Control function	Position control/Speed control/Torque control (Parameter switching)	
Control system	IGBT: PWM control sinusoidal drive	
Main Circuit Power Supply *1	3-phase: 200 to 240 V AC +10, -15%, 50/60 Hz±3 Hz Single-phase: 200 to 240 V AC +10, -15%, 50/60 Hz±3 Hz *2 Single-phase: 100 to 120 V AC +10, -15%, 50/60 Hz±3 Hz *3	
Control Power *1	Single-phase: 200 to 240 V AC +10, -15%, 50/60 Hz±3 Hz Single-phase: 100 to 120 V AC +10, -15%, 50/60 Hz±3 Hz *3	
Environment	Ambient temperature Storage temperature Operation/Storage humidity Elevation Vibration Shock	0 to +55°C -20 to +65°C Below 90%RH (no condensation) Below 1000 m 4.9 m/s ² freq. range 10 to 55 Hz tested for 2 hours in each X, Y and Z-axis directions 19.6 m/s ²
Structure	10 to 300 A: Built-in tray-type power supply, 600 A: Separate power supply unit	

Performance

Speed control range	1:5000 (Internal speed command)
Frequency characteristics	2200 Hz (In high frequency sampling mode) *Differs for each model.
Permissible load moment of inertia	10 times motor rotary inertia

Built-in functions

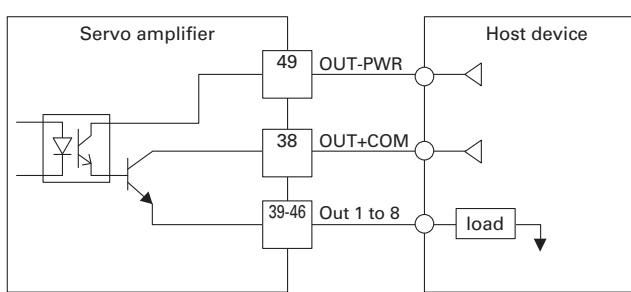

Protection functions	Over current, Current detection error, Overload, Regeneration error, Overheating, External disorder, Over voltage, Main circuit power low voltage, Main circuit power supply open phase, Control power supply low voltage, Encoder error, Over speed, Speed control error, Speed feedback error, Unreasonable position deviation, Position command pulse error, Built-in memory error, Parameter error, Cooling fan error
Digital operator	Status display, Monitor display, Alarm display, Parameter setting, Test run, Adjustment mode
Dynamic brake circuit	Built-in
Regenerative resistor	10 A to 150 A: Built-in/external type, 300 A to 600 A: External type
Monitor	Speed monitor (VMON) 2.0 V±10% (at 1000 min ⁻¹) Torque command monitor (TCMON) 2.0 V±10% (at 100%)

Safety standards

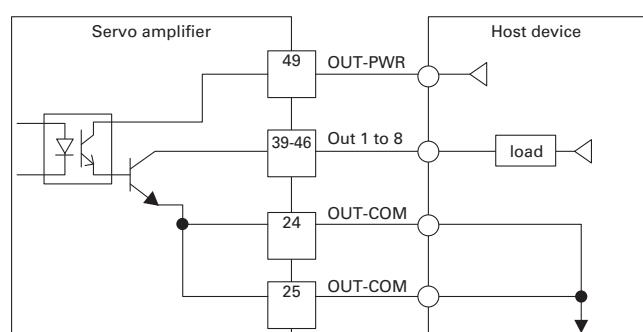

Servo amplifier type	Safety standards		
All models	North American safety standards (UL ratings)	UL508C	
	European directive	Low-voltage directive	• EN61800-5-1
		EMC directive	• EN55011 G1 ClassA • EN61800-3 • EN61326-3-1
	KC Mark (Korea Certification Mark)	KN61000-6-2, KN61000-6-4	
Models with safety features	Safety feature standards	• IEC61508, SIL3 • IEC62061, SILCL3	• ISO13849-1, Cat.3, PL=e

AWG	SQ (mm²)		
26	0.15	150 or less	5
24	0.2	100 or less	10
22	0.3	60 or less	15
20	0.5	40 or less	25
18	0.75	25 or less	40

Conductor resistance differs according to conductor specifications.

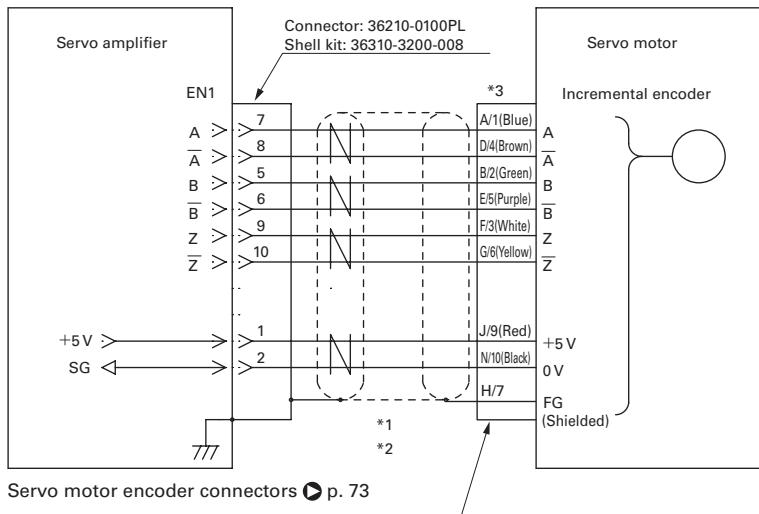

*3 Battery lines (EBAT+, EBAT-) are necessary only when a battery-backup method absolute encoder is used.

*4 Lead wire colors are indicated in parentheses. For lead wire colors and circular connector pin numbers, see the following table.

	ES+	ES-	EBAT+	EBAT-	+5V	0V	FG
100 mm sq. or less	Brown	Blue	Pink *3	Purple *3	Red	Black	Shielded
130 mm sq. or more	1	2	8 *3	4 *3	9	10	7

■ Pulse Encoder

- Wire-saving incremental encoder

Servo motor encoder connectors (p. 73)

Circular connector model No.:

Flange size: 130 mm sq. or more	JN2DS10SL1-R	JN2FS10ML1-R
	JN2DS10SL2-R	JN2FS10ML2-R
	JN2DS10SL3-R	JN2FS10ML3-R

*1 Use a twisted pair shielded cable.

*2 Maximum cable lengths by conductor size of the power supply cable (5 V, SG)

Conductor size		Conductor resistance (Ω/km) *20°C	Length (m)
AWG	SQ (mm²)		
26	0.15	150 or less	5
24	0.2	100 or less	10
22	0.3	60 or less	15
20	0.5	40 or less	25
18	0.75	25 or less	40

Conductor resistance differs according to conductor specifications.

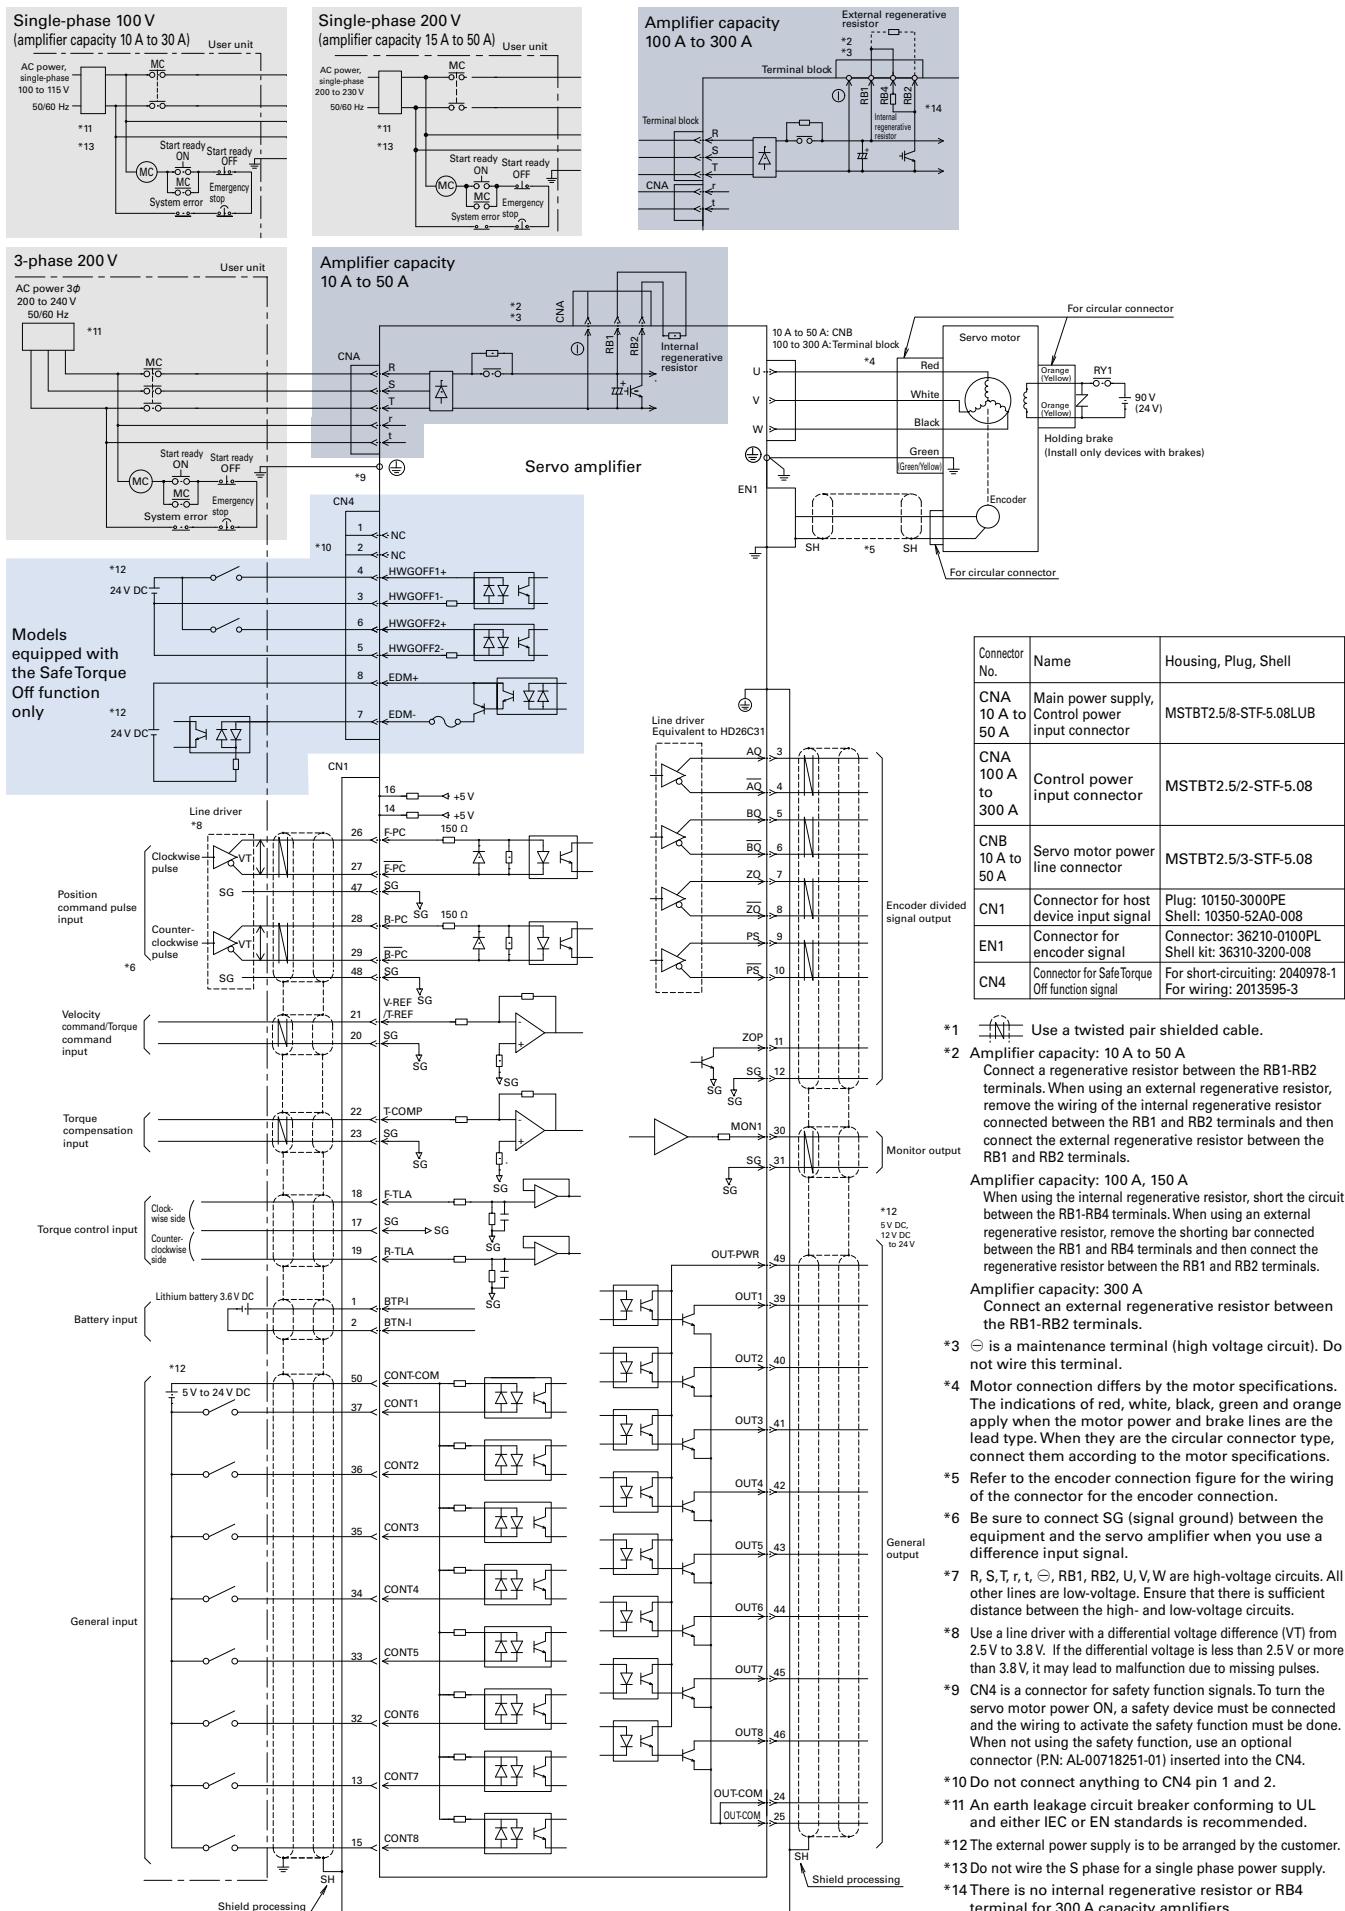

*3 Lead wire colors are indicated in parentheses. For lead wire colors and circular connector pin numbers, see the following table:

	A	\bar{A}	B	\bar{B}	Z	\bar{Z}	+5V
100 mm sq. or less	Blue	Brown	Green	Purple	White	Yellow	Red
130 mm sq. or more	1	4	2	5	3	6	9

	0V	FG
100 mm sq. or less	Black	Shielded
130 mm sq. or more	10	7

External Wiring Diagram

Servo amplifier: 10 A to 300 A, Source output

*1 Use a twisted pair shielded cable.

*2 Amplifier capacity: 10 A to 50 A

Connect the regenerative resistor between the RB1-RB2 terminals. When using an external regenerative resistor, remove the wiring of internal regenerative resistor connected between the RB1 and RB2 terminals and then connect the external regenerative resistor between the RB1 and RB2 terminals.

Amplifier capacity: 100 A, 150 A

When using the internal regenerative resistor, short the circuit between the RB1-RB4 terminals. When using an external regenerative resistor, remove the shorting bar connected between the RB1 and RB4 terminals and then connect the regenerative resistor between the RB1 and RB2 terminals.

Amplifier capacity: 300 A

Connect an external regenerative resistor between the RB1-RB2 terminals.

*3 \ominus is a maintenance terminal (high voltage circuit). Do not wire this terminal.

*4 Motor connection differs by the motor specifications. The indications of red, white, black, green and orange apply when the motor power and brake lines are the lead type. When they are the circular connector type, connect them according to the motor specifications.

*5 Refer to the encoder connection figure for the wiring of the connector for the encoder connection.

*6 Be sure to connect SG (signal ground) between the equipment and the servo amplifier when you use a difference input signal.

*7 R, S, T, r, t, \ominus , RB1, RB2, U, V, W are high-voltage circuits. All other lines are low-voltage. Ensure that there is sufficient distance between the high- and low-voltage circuits.

*8 Use a line driver with a differential voltage difference (VT) from 2.5 V to 3.8 V. If the differential voltage is less than 2.5 V or more than 3.8 V, it may lead to malfunction due to missing pulses.

*9 CN4 is a connector for safety function signals. To turn the servo motor power ON, a safety device must be connected and the wiring to activate the safety function must be done. When not using the safety function, use an optional connector (PN: AL-00718251-01) inserted into the CN4.

*10 Do not connect anything to CN4 pin 1 and 2.

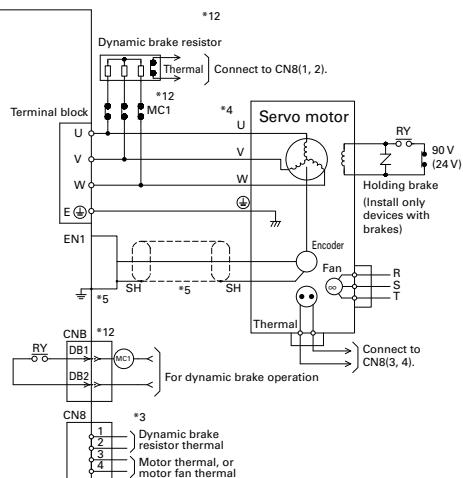

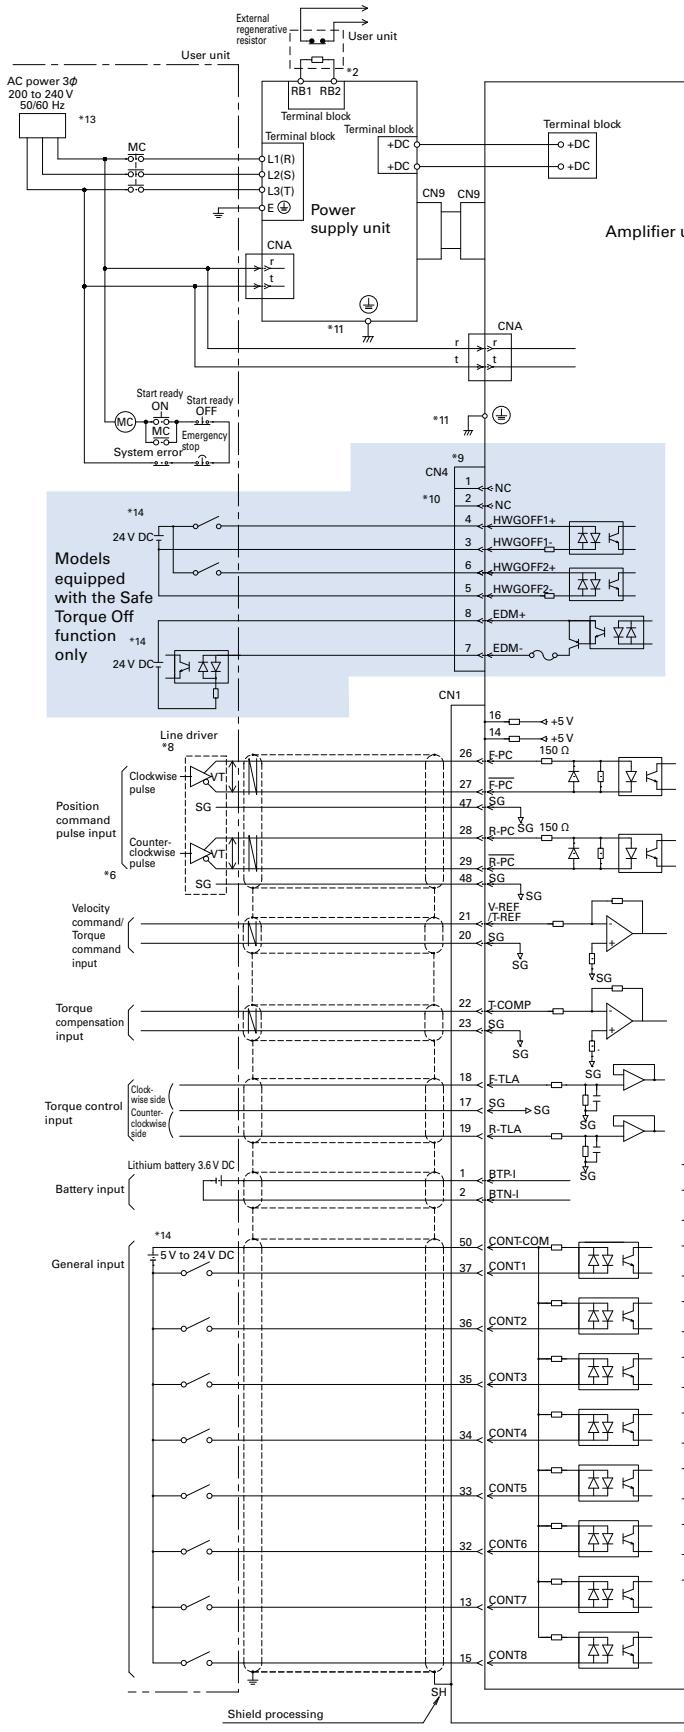

*11 An earth leakage circuit breaker conforming to UL and either IEC or EN standards is recommended.

*12 The external power supply is to be arranged by the customer.

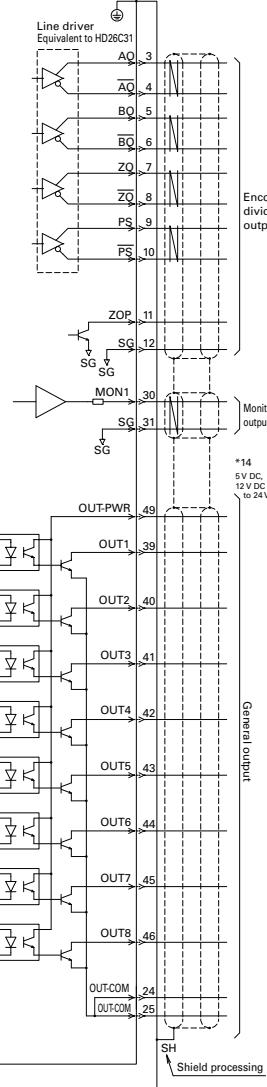

*13 Do not wire the S phase for a single phase power supply.

*14 There is no internal regenerative resistor or RB4 terminal for 300 A capacity amplifiers.

Servo amplifier: 600 A, Sink output

Connector No.	Name	Housing, Plug, Shell
CNA	Control power input connector	MSTBT2.5/2-STF-5.08
CN1	Connector for host device input signal	Plug: 10150-3000PE Shell: 10350-52A0-008
EN1	Connector for encoder signal	Connector: 36210-0100PL Shell kit: 36310-3200-008
CN8	Connector for external thermal	FMC0,5/4-ST-2.54
CNB	Connector for dynamic brake operation	MSTBT2.5/3-STF-5.08

- *1 Use a twisted pair shielded cable.
- *2 Connect an external regenerative resistor between the RB1-RB2 terminals.
- *3 When thermal monitoring is handled by the customer, short the circuit.
- *4 Motor connection differs by the motor specifications. Connect them according to the motor specifications.
- *5 Refer to the encoder connection figure for the wiring of the connector for the encoder connection.
- *6 Be sure to connect SG (signal ground) between the servo motor and the servo amplifier when you use a difference input signal.
- *7 R, S, T, r, t, P, N, RB1, RB2, U, V, W are high-voltage circuits. All other lines are low-voltage. Ensure that there is sufficient distance between the high- and low-voltage circuits.
- *8 Use a line driver with a differential voltage difference (VT) from 2.5 V to 3.8 V. If the differential voltage is less than 2.5 V or more than 3.8 V, it may lead to malfunction due to missing pulses.
- *9 CN4 is a connector for safety function signals. To turn the servo motor power ON, a safety device must be connected and the wiring to activate the safety function must be done. When not using the safety function, use an optional connector (P.N: AL-00718251-01) inserted into the CN4.
- *10 Do not connect anything to CN4 pin 1 and 2.
- *11 Ground with a wire of 5.5 mm² or more.
- *12 DB1 and DB2 are dynamic brake timing outputs. The electromagnetic contactor, resistor, power supply, and wiring are to be arranged by the customer. For the electromagnetic contactor, arrange a DC drive type. Contact rating 30 V DC 2 A ($\text{COS}\phi=0.4$, $L/R=r_{rms}$)
- *13 An earth leakage circuit breaker conforming to UL and either IEC or EN standards is recommended.
- *14 External power supply is to be arranged by the customer.

Notes on Replacing Our Conventional Products

Note the following when replacing our conventional products such as servo amplifier SANMOTION R ADVANCED MODEL with SANMOTION R 3E Model.

■ Position Command Pulse Input

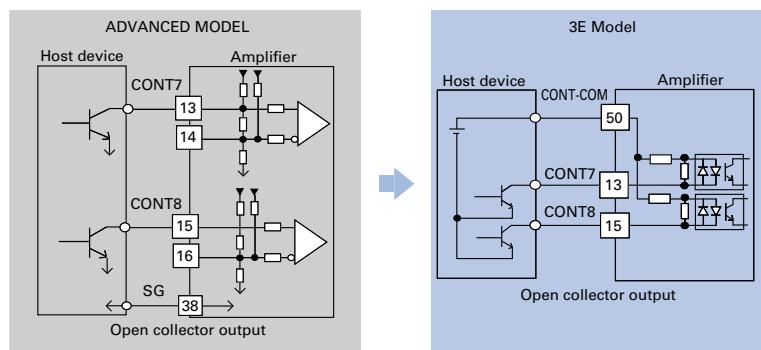

There are constraints on the specifications of the available position pulse signals for the SANMOTION R 3E Model. Also, for the open collector type, a wiring change is necessary.

Pulse output circuit of the host devices	Wiring compatibility	Constraint conditions
Differential output type (Line driver)	Yes	Voltage difference of differential signal (VT) : 2.5 to 3.8 V
Open collector Type	No	Saturation voltage of the transistor (VCE): 1.5 V max.

■ General input

For the SANMOTION R 3E Model, differential (line driver) output type cannot be used as a host device side output circuit. Also, a wiring change is necessary even if open collector output is used.

General output circuit of the host devices	Wiring compatibility	Constraint conditions
Differential output type (Line driver)	-	Change to open collector type.
Open collector Type	No (Refer to the figure)	Wire in a similar way to CONT1 to 6.

■ Connecting between servo amplifier units

600 A

Name	Item	Model no.
Copper bar	To connect main power supply between power supply unit and amplifier unit Terminal number: Between +DC/-DC 2-pc. set (5 mm between units)	AL-00918125-01
Connecting cable between units	To connect between power supply unit (CN9) - Amplifier unit (CN9)	AL-00917284

■ Servo Motor Encoder Connectors

Manufacturer: Japan Aviation Electronics Industry Limited

R2 Servo Motor

Motor flange size	Combination plug for encoder (with rubber bushing)		Encoder receptacle model number (motor side)	Applicable cable diameter (bushing color phase)	Pin Layout Symbol
	Straight	Angle			
130 mm sq. to 220 mm sq.	JN2DS10SL1-R	JN2FS10SL1-R	JN2AS10ML2-R	Φ 5.7 to 7.3 mm (Black)	See the encoder wiring diagram on p. 38.
	JN2DS10SL2-R	JN2FS10SL2-R		Φ 6.5 to 8.0 mm (Gray)	
	JN2DS10SL3-R	JN2FS10SL3-R		Φ 3.5 to 5.0 mm (Brick)	

Select the correct plug and contacts for the size of cable to be used. The manufacturer's model number and the model number for parts procured from SANYO DENKI are the same number.

Applicable contact for encoder plug*1, 2

Contact size	Category	Applicable contact	
		Socket contact model No.	Applicable wire size
#22	Manual crimp tool type *3,4	JN1-22-20S-R-PKG100	AWG #20
		JN1-22-22S-PKG100	AWG #21 to #25
		JN1-22-26S-PKG100	AWG #26 to #28
	Solder type	JN1-22-22F-PKG100	AWG #20

*1 : Select the correct plug and contacts for the size of cable to be used. The manufacturer's model number and the model number for parts procured from SANYO DENKI are the same number.

*2 : When removing a contact that has already been inserted, use a removal tool. Purchase the removal tool from the connector manufacturer (Japan Aviation Electronics Industry Limited).

*3 : For the manual crimp tool part number, see the instruction manuals from the connector manufacturer (Japan Aviation Electronics Industry Limited).

*4 : Purchase the semi-automatic crimp tool from the manufacturer (Japan Aviation Electronics Industry Limited).

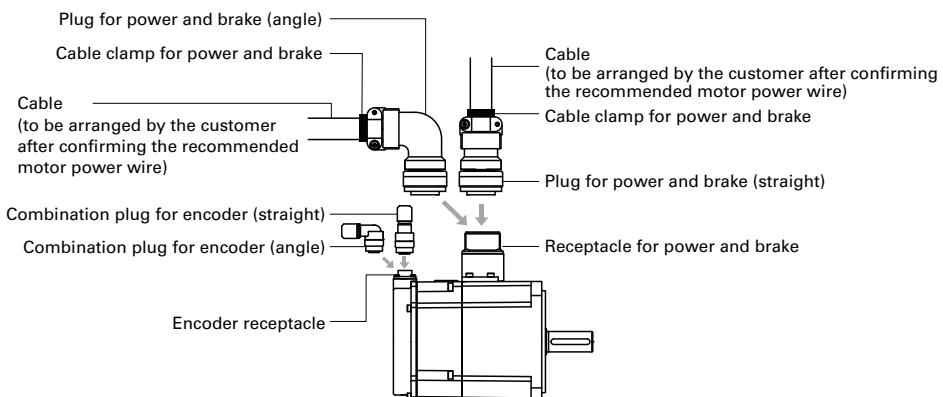

*5 : For the connector and contact instructions, precautions, etc., see the catalogs and instruction manuals from the connector manufacturer (Japan Aviation Electronics Industry Limited).

■ Cooling fan connector to connect motor

■ Servo motor capacity selection

This is a method of calculating the required capacity of servo motors from the mechanical specifications. Here we have introduced the basic selection procedure focusing on a ball screw (flat) mechanism.

Selection procedure

1. Creation of operation patterns

Create the operation patterns.

2. Calculation of conversion of motor shaft moment of load inertia J_L

Calculate the moment of load inertia from the machine configuration.

3. Calculation of load torque T_L for motor shaft conversion

Calculate the load torque from the machine configuration.

4. Provisional selection of servo motor capacity

Provisionally select a motor in which the load moment of inertia (J_L) is 10 times or less than the rotor moment of inertia (J_M) of servo motor, while the load torque (T_L) is 80% or less ($T_R \times 0.8$) of rated torque of motor (T_R).

$$J_L \leq J_M \times 10$$

$$T_L \leq T_R \times 0.8$$

5. Calculation of acceleration/deceleration torque

Calculate the required acceleration/deceleration torque from the operation patterns.

6. Calculation of effective torque

Calculate the effective torque from the torque patterns.

7. Judgment

Determine whether the acceleration/deceleration torque (T_a , T_b) is 80% or less ($T_p \times 0.8$) of peak stall torque (T_p) of servo motor, and the effective torque (T_{rms}) is 80% or less ($T_R \times 0.8$) of rating torque (T_R) of servo motor.

$$T_a \leq T_p \times 0.8$$

$$T_b \leq T_p \times 0.8$$

$$T_{rms} \leq T_R \times 0.8$$

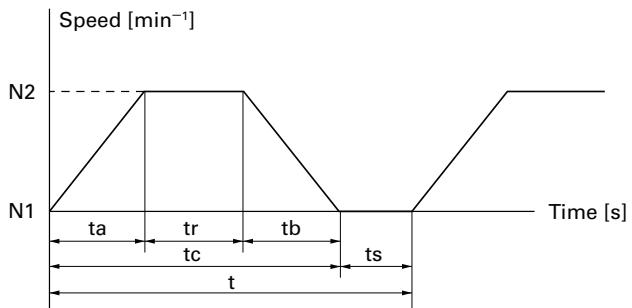

If the judgment results cannot be applied in the aforementioned equation, reconsider the servo motor capacity, for example increasing the capacity.

8. Calculation of regenerative power

Calculate the regenerative power and select an external regenerative resistor if necessary.

1. Creation of operation patterns

First, determine the equipment mechanism, dimensions of all parts, positioning amount, positioning time, gear ratio, etc. An operation pattern is the determined driving force plotted on the speed/time axis.

ta = Acceleration time [s]

tb = Deceleration time [s]

tr = Constant speed-time [s]

ts = Downtime [s]

t = 1 cycle [s]

2. Calculation of conversion of motor shaft moment of load inertia J_L

Load moment of inertia is the quantity showing inertia of a rotating object.

Given below is the calculation method used in case of ball screw (flat) mechanism.

■ Ball screw moment of inertia

$$J_{L1} = \left(\frac{1}{G} \right)^2 \times \frac{\pi \times \rho \times D^4 \times L}{32} \quad [\text{kg} \cdot \text{m}^2]$$

G: Gear ratio

ρ : Ball screw specific gravity [kg/m^3] [Iron: 7.8×10^3]

D: Ball screw diameter [m]

L: Ball screw length [m]

■ Work + table moment of inertia

$$J_{L2} = \left(\frac{1}{G} \right)^2 \times W \times \left(\frac{P}{2\pi} \right)^2 \quad [\text{kg} \cdot \text{m}^2]$$

G: Gear ratio

W: Work + table mass [kg]

P: Ball screw pitch [m]

■ Conversion of motor shaft moment of load inertia.

$$J_L = J_{L1} + J_{L2}$$

* Moments of inertia of reducer and coupling are assumed to be negligible and have therefore been omitted.

3. Calculation of load torque T_L for motor shaft conversion

Load torque is the power generated from the friction of the driving part or from the gravity that is converted on the motor shaft. When activated, this torque always acts as the load. Given below is the calculation method used in the case of a ball screw (flat) mechanism.

$$T_L = \frac{(F + \mu W)}{\eta} \times \frac{P}{2\pi} \times \frac{1}{G} \times 9.8 \quad [\text{N}\cdot\text{m}]$$

F: External force [kg]

η : Machine efficiency

μ : Coefficient of friction

W: Work + table mass [kg]

P: Ball screw pitch [m]

G: Gear ratio

4. Provisional selection of servo motor capacity

Provisionally select the motors that apply to the following 2 conditions.

- Load moment of inertia (J_L) calculated in step 2 is 10 times or less than the rotor moment of inertia (J_M) of servo motor
 $J_L \leq J_M \times 10$
- Load torque (T_L) calculated in step 3 is 80% or less ($T_R \times 0.8$) of rated torque (T_R) of servo motor
 $T_L \leq T_R \times 0.8$

5. Calculation of acceleration/deceleration torque

Acceleration/deceleration torque is necessary for accelerating and decelerating the motor and load.

■ Method of obtaining acceleration torque (T_a)

$$T_a = \frac{2\pi(N_2 - N_1) \times (J_L + J_M)}{60 \times t_a} + T_L \quad [\text{N}\cdot\text{m}]$$

N_2 : Servo motor rotary speed after acceleration [min^{-1}]

N_1 : Servo motor rotary speed before acceleration [min^{-1}]

J_L : Conversion of motor shaft moment of load inertia [$\text{kg}\cdot\text{m}^2$]

J_M : Conversion of servo motor moment of rotor inertia [$\text{kg}\cdot\text{m}^2$]

T_L : Calculation of load torque for motor shaft conversion [$\text{N}\cdot\text{m}$]

t_a : Acceleration time [s]

■ Method of obtaining deceleration torque (T_b)

$$T_b = \frac{2\pi(N_2 - N_1) \times (J_L + J_M)}{60 \times t_b} - T_L \quad [\text{N}\cdot\text{m}]$$

N_2 : Servo motor rotary speed before deceleration [min^{-1}]

N_1 : Servo motor rotary speed after deceleration [min^{-1}]

J_L : Conversion of motor shaft moment of load inertia [$\text{kg}\cdot\text{m}^2$]

J_M : Conversion of servo motor moment of rotor inertia [$\text{kg}\cdot\text{m}^2$]

T_L : Calculation of load torque for motor shaft conversion [$\text{N}\cdot\text{m}$]

t_b : Deceleration time [s]

6. Calculation of effective torque

Effective torque is the value per unit time obtained from root mean square of load torque / acceleration torque / deceleration torque .

$$Trms = \sqrt{\frac{(T_a^2 \times t_a) + (T_L^2 \times t_r) + (T_b^2 \times t_b)}{t}} \quad [\text{N}\cdot\text{m}]$$

7. Judgment

Our company's judgment criteria are as follows.

- Load torque load factor $T_L \leq T_R \times 0.8$
(Load torque is 80% or less of rated torque)
- Acceleration torque load factor $T_a \leq T_p \times 0.8$
(Acceleration torque is 80% or less of peak stall torque)
 T_p : Peak stall torque
- Deceleration torque load factor $T_b \leq T_p \times 0.8$
(Deceleration torque is 80% or less of peak torque at stall)
 T_p : Peak stall torque
- Effective torque load factor $Trms \leq T_R \times 0.8$
(Effective torque is 80% less than rated torque)
- Moment of inertia ratio $J_L \leq J_M \times 10$
(Load moment of inertia is 10 times or less than the rotor moment of inertia of motor)

Rise in motor temperature can be suppressed by keeping a large margin in torque load factor. The moment of inertia ratio can be controlled at 10 times or more, for example, by slowly rotating the table mechanism. Testing with an actual machine is recommended.

8. Calculation of regenerative power

Calculate the regenerative efficient power (PM) to determine the regenerative resistor to be used. From the calculation results, determine whether an internal regenerative resistor can be used.

■ Method of obtaining regenerative efficient power (PM) of horizontal drive shaft
Derive the regenerative energy.

$$EM = Ehb = \frac{1}{2} \times N \times 3 \times Ke\phi \times \frac{T_b}{KT} \times tb - \left(\frac{T_b}{KT} \right)^2 \times 3 \times R\phi \times tb$$

EM: Regenerative energy in case of horizontal drive shaft [J]

Ehb: Regenerative energy during deceleration [J]

Ke ϕ : Induced voltage constant [$\text{Vrms}/\text{min}^{-1}$] (motor constant)

KT: Torque constant [$\text{N}\cdot\text{m}/\text{Amps}$] (motor constant)

N: Motor rotary speed [min^{-1}]

R ϕ : Armature resistance [Ω] (motor constant)

tb: Deceleration time [s]

T_b: Deceleration torque [$\text{N}\cdot\text{m}$]

Derive the regenerative efficient power from regenerative energy.

$$PM = \frac{EM}{t}$$

PM: Regenerative efficient power [W]

EM: Regenerative energy [J]

t: Cycle time [s]

■ Selection of regenerative resistor

Select a regenerative resistor that meets the following conditions.

- In case of servo amplifiers with an internal regenerative resistor:
Permissible regenerative power [PR] that is less than efficient regenerative power [PM] and can be used with internal regenerative resistors
- In case of external regenerative resistor:
Permissible regenerative power [PRO] that is less than efficient regenerative power [PM] and can be used with external regenerative resistors

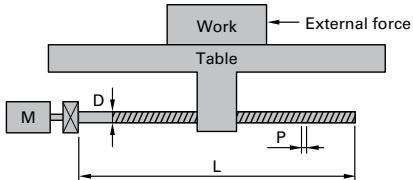

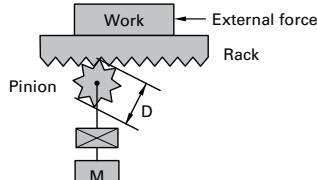

Note that we have servo amplifier models both with and without internal regenerative resistors for absorbing regenerative power.

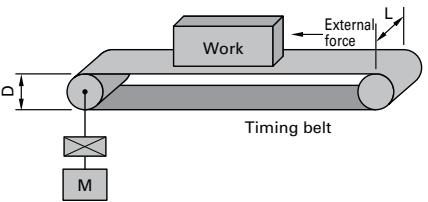

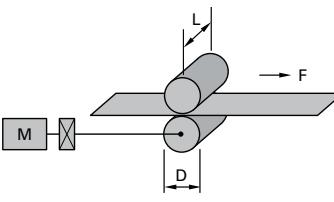

Select the model accordingly.

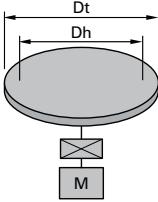

Selection Guide

■ Selection data for each mechanism

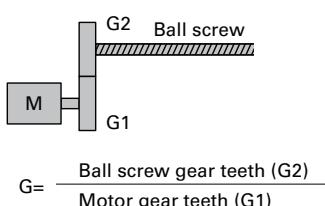

Typical examples of mechanisms and items that require selection are shown below. Provide this information when placing an order.

Ball screw		Rack & pinion

■ Precautions For Adoption

Failure to follow the precautions on the right may cause moderate injury and property damage, or in some circumstances, could lead to a serious accident.
Always follow all listed precautions.

⚠ Cautions

- Read the accompanying Instruction Manual carefully prior to using the product.
- If applying to medical devices and other equipment affecting people's lives, please contact us beforehand and take appropriate safety measures.
- If applying to equipment that can have significant effects on society and the general public, please contact us beforehand.
- Do not use this product in an environment where vibration is present, such as in a moving vehicle or shipping vessel.
- Do not perform any retrofitting, re-engineering, or modification to this equipment.
- The products presented in this catalog are meant to be used for general industrial applications. If using for special applications related to aviation and space, nuclear power, electric power, submarine repeaters, etc., please contact us beforehand.

*For any question or inquiry regarding the above, contact our Sales Department.
